

The purpose of this ecosystems with biotic organisms like fish, birds, and plants, and abiotic elements like rocks, sun, and water, work together to:

Support life - by providing energy through food chains.

Recycle nutrients - through decomposition.

Provide habitats - for diverse species.

Regulate the environment - by controlling conditions like temperature and weather.

These interactions ensure balance and sustain life within the ecosystem.

This ecosystem will work together with this Abiotic components like the sun, water, rocks, and clouds work together with biotic organisms like trees, birds, crabs, plants, fish, flowers, and bees by:

Sunlight - powers photosynthesis in plants, which supports the entire food chain.

Water - sustains all life, supports plant growth, and provides habitats for aquatic organisms.

Rocks - contribute to soil formation and create habitats.

Clouds - bring rain, nourishing plants and replenishing water sources.

These interactions create a balanced environment where life can thrive.

I chose this ecosystem because it will work together because I chose the right biotic and abiotic organisms that are suitable for a good ecosystem.
